```

问题

- 1. BahamutConfig配置项冗长,包含全局配置和app层面的个性化配置
- 2. diamond中更改配置项不便,出错会导致整个配置文件不可用
- 3. 配置历史版本管理不便

需求

方便、快速的推送

历史版本管理&回滚

增删、修改字段方便

配置强校验

与biz多版本兼容

配置方案

- 使用与diamond类似的配置中心;
- 将配置保存在数据库中;
- 用git进行文件管理 api 🗙

biz \checkmark

优势	劣势
有完善的管理方案、发布流程	部署、维护需要成本 不能完全满足个性化需求
以服务形式从前端交互,更改简单	实现比较复杂
热更新	版本管理不易实现
强大的版本管理;	动态配置无法热更新
易用,学习成本低	需要自己搭建推送流程

Diamond Config重构 Prove of concept

- 1. 服务器上如何获取从gitlab获取配置包?
- 2. 配置包如何自动化上传?
- 3. 如何指定配置的版本?

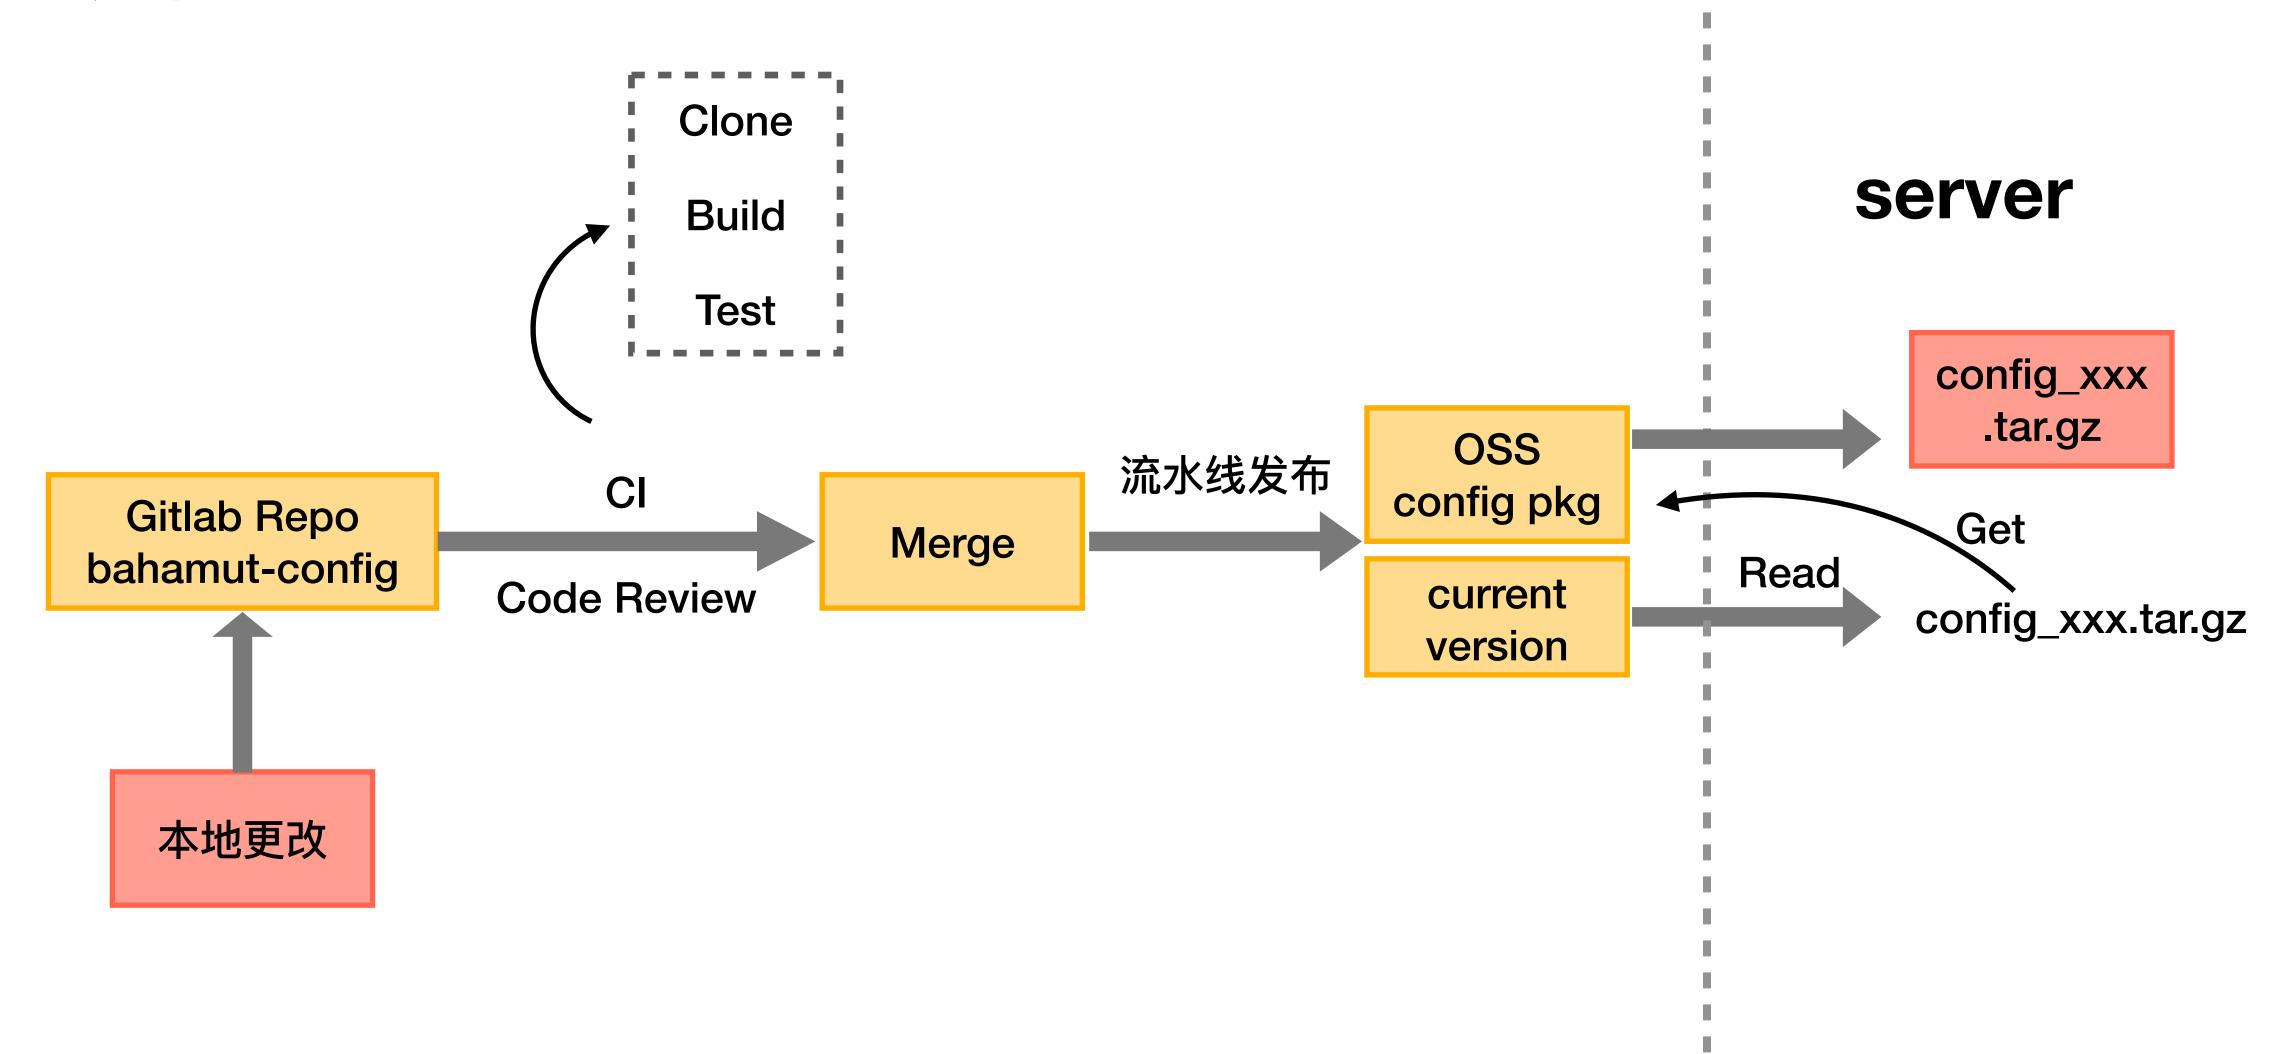

Diamond Config重构 Prove of concept

- 4. config是与代码放在同一个repo里还是分开存放?
- 5. 如何对config的内容进行校验?

Configuration as code

Configuration as code (CAC) is managing configuration resources in your source repository. You treat your application config resources as versioned artifacts.

发布流程

基于文件的config组织形式

按模块层次划分

bahamut-config.git

```
config/
global_config.json
env/
na61.json
...
app/
100000231.json
...
```

```
{
    "INC_JOIN": {
        "RuntimeParam": {...},
        "BlinkJobOption": {...},
        "ResourceConfig": {...}
    },
    "FULL_SYNC": {
        "RuntimeParam": {...},
        "BlinkJobOption": {...},
        "ResourceConfig": {...}
    },
    ...
}
```

Class BahamutAppConfig

读取

Class RuntimeParam

Class BlinkJobOption

Class ResourceConfig

config调用

固定接口:

configProvider.getGlobalConfig()

.getEnvConfig(env)

.getAppConfig(app)

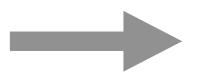

.getJobConfig(app, job)

可扩展:

configProvider.get(Pojo.class)

e.g. configProvider.get(RuntimeJobConfig.cl ass)

-> return RuntimeJobConfig rjc

Return POJOs

config校验

开发者增加配置字段时,需要很方便地设置相应的校验规则。

- Use annotation:

```
@Max(value=120)
@Min(value=0)
Int windowInSecond;
@Pattern(regexp = "[a-zA-Z_]+\\:[0-9]+")
@Numeric
```

遍历每个文件,检查文件格式和内容合法性

Config repo中只存放配置文件,把校验逻辑代码放在代码repo中

对比

	Diamond	基于文件的Config
存储	在diamond中用单个文件存储所有app配置	以文件形式分别存储每个app的配置
读取	提供group id, data id,从diamond接口中读取	下载config包,用provider接口从文件中 读取
修改	在diamond中修改,不便于编辑、 查找	在ide中修改,有语法检查和高亮
发布	通过diamond发布	通过流水线上传OSS,加入合法性检查

迁移

- 先上线pipeline,再逐步替换使用点
- 迁移前进行Consistency test
- config文件中逐渐增加字段,diamond中逐渐删除

谢谢!
